

Katcon Engineering specializes particularly in the engineering, supply and erection of mechanical conveyors and silo extraction devices for bad flowing bulk products.

Products that are very sticky, abrasive, bridge building or cured cause problems when storing in bunkers and silos or even during unloading. Also, transporting and feeding of these products may be associated with blockages, encrustations and jamming of transporters with adverse consequences.

Together with the exclusive representation of prominent suppliers in this field KATCON Engineering will gladly toe the line.
